DESCRIPTION: The Ronan Model X57-620 series accepts a mA or voltage input in a safe area and accurately repeats it as a mA output to a load in the hazardous area. The module utilizes transformers to provide isolation between the safe and hazardous areas and from the power supply. The safe area and hazardous circuits are independently floating and either, or both, may be grounded. However, an intrinsically safe ground connection is not required. The outputs of the X57-620 series can be adjusted for either "true zero" (0 mA) or "live zero" (4 mA) values with either of the zero values as inputs. Voltage outputs may be generated in the hazardous area by connection of an appropriate loop resistor across terminal 5 and 7. For example, a 250 ohm resistor provides 1 to 5 V signal over the range of 4 to 20 mA.
